Selenium webdriver

■ Abstract ∨

Create a simple selenium webdriver script for browser/programming language of your choice

Step 1: Install selenium and its language binding of your choice

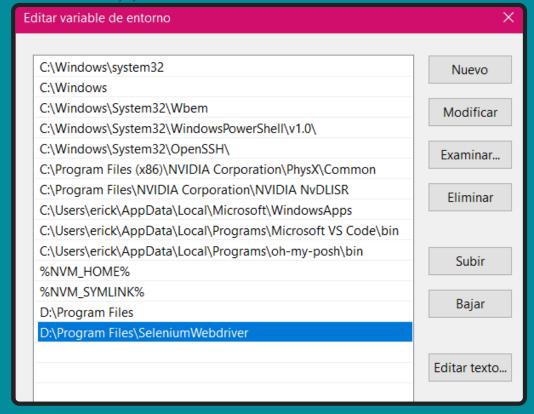

Step 2 : Create a simple test which launches the URL and then does a click somewhere

1 Installing dependencies >

As I choosed Javascript and NodeJs to do this assignment, after inicialited the node project and created the package.json, I just install selenium-webservice running

npm install selenium-webdriver --save

Also, in order to work with the browser Chrome, I downloaded a component called **chromedriver**. I just set the path of the executable in my systems PATH

Code ∨

```
//Importar las funciones necesarias de selenium-webdriver
const {Builder, By} = require('selenium-webdriver');

async function searching() {
    //Llama al navegador que se usará en la prueba
    let driver = await new Builder().forBrowser('chrome').build();
    //Dirige a la página que se quiere analizar
    await driver.get('https://www.thingiverse.com/');
```

Donde

Importar las funciones necesarias de selenium-webdriver:

```
const {Builder, By} = require('selenium-webdriver');
```

Llama al navegador que se usará en la prueba y dirige a la página que se quiere analizar

```
let driver = await new Builder().forBrowser('chrome').build();
await driver.get('https://www.thingiverse.com/');
```

Detecta el primer resultado de la página (todos tienen la clase SearchResult_searchResultItem--c4VZk), después ubica el link dentro (con la clase ThingCardBody__cardBodyWrapper--ba5pu) y manda un click

```
await driver
.findElement(By.className('SearchResult__searchResultItem--c4VZk'))
.findElement(By.className('ThingCardBody__cardBodyWrapper--ba5pu'))
.click();
```
